

Sprint Retrospective

What went well	What went wrong	What can be mproved
Sign-up, login and authentication works well, including user database creation	Automated deployment via Travis-ci failed, had to deploy app manually	Clearer task allocation
App successfully deployed on azure	Underestimated story point for login, sign-up and authentication, took longer than expected	Better sprint planning
Login, sign-up works well with database	Difficulty understanding each others code	Use sepearate branches for developer stories/issues
	Poor planning for sprint from the start. Confusions in duties and tasks caused delay	Improve on time management

Sprint velocity

User stories completed	Story point assigned
As a student I want to be able to create an account to access the app	5
As a student I want to be able to log into my account to access the app	5
Total sprint velocity sprint #1	10
